AUTHOR: Fedorov, N. N.

TITLE: Incidence of plane waves on the interface between vacuum and an inhomogeneous absorbing medium

SOURCE: IVUZ. Radiotekhnika, v. 7, no. 1, 1964, 85-90

TOPIC TAGS: Maxwell's equations, plane wave incidence, inhomogeneous medium, medium and vacuum interface, incident field component, reflected field component, orthogonal field component, absorption in inhomogeneous medium, medium with small anisotropy

ABSTRACT: A modified set of Maxwell's equations is derived for a wave induced in an inhomogeneous medium with an anisotropic dielectric constant (in all three dimensions) by a plane wave incident on the boundary between this medium and the vacuum. It is pointed out that a general solution for this case (and all the more for the case

Card 1/3

ACCESSION NR: AP4024490

when the magnetic permeability also varies in space) is mathematically very difficult, but under some simplifying assumptions manageable results that facilitate engineering calculations can be obtained. The simplified cases considered are strong absorption in the inhomogeneous medium and when the derivatives of the dielectric constant with respect to the spatial coordinates are small. The mathematical procedure is based on an idea of M. I. Vishik and L. A. Lyusternik (UMM, 1960, v. 15, no. 4 and no. 94). The calculations show that in the general case there can arise on the interface between the media, in addition to the incident and reflected components of the magnetic field, also supplementary magnetic and electric components orthogonal to them, yielding information on the properties of the second medium due to its inhomogeneities and contributing to the diffraction field which can be readily calculated. 2331. NONLINEAR DISTORTIONS IN FREQUENCY GEN- 621.373.42.018.783
ERATORS WITH AN INERTIA NONLINEARITY IN THE
RESONANT CIRCUIT. N.N. Fedorov

Radiotekhnika, Vol. 10, No. 11, 33-8 (1955). In Russian.
The frequency of a tuned-anode oscillator is stabilized
and its waveform improved by inserting a filament lamp in
series with the tuning coil; the filament (inertia nonlinearity)
distorts rather than improves the waveform at I.F. Operation
of the system is analysed by means of two differential equa-
tions, which describe the thermal equilibrium of the filament
and the current flowing through the coil. The equations are
solved approximately by the "small parameter" method. The
filament is shown to introduce a second-order third harmonic
component whose amplitude is proportional to the cube of the
amplitude of the fundamental, and is a decreasing function of
frequency.

SUBJECT USSR / PHYSICS
 AUTHOR FEDOROV, N.N., TALYZIN, V.M.
 TITLE The Cross Sections of the Nonelastic Interaction of 14,5 MeV-
 Neutrons with Different Elements.
 PERIODICAL Atomnaja Energija, 1, fasc. 4, 155-157 (1956)
 Issued: 10 / 1956 reviewed: 11 / 1956

At first the measuring results obtained on various occasions in America were described as being unreliable. In the present work (which was completed in its essential parts already in 1952) a detector with variable threshold value, namely a scintillation counter with a stilb crystal, was used. The cross sections of 24 elements were measured. The detector was installed at a distance of 75 cm from the circonium-tritium target of the ion-accelerator tube at an angle of 0° to the bundle of deuteron-ions. Samples were spherical. For all samples the curves of the dependence of the ratio of the counting velocities with and without sample on the threshold value of the detector were determined. These curves have domains in which the ratio remains constant. In this case the detector registers only the primary and elastically scattered neutrons. As a monitor a proportionality counter was used which registers the α -particles accompanying the 14,5 MeV neutrons. The background of the scattered neutrons amounted to from 1,5 to 0,6 % of the primary neutron bundle at detector threshold values of from 9 to 12 MeV. Within this domain the detector was insensitive to the γ -quanta occurring on the occasion of a nonelastic interaction of the neutrons.

Atomnaja Energija, 1, fasc.4, 155-157 (1956) CARD 2 / 2 PA - 1483

The here measured cross sections of the nonelastic interaction of 14,5 MeV neutrons are shown in a table and are compared with the results obtained by other authors. Agreement is rather good. The cross section of the nonelastic interaction of neutrons with nearly all nuclei investigated on this occasion is a monotonous function of atomic weight and is described by the formula

$\sqrt{\sigma_{in}/\pi} = (1,2 A^{1/3} + 2,1) \cdot 10^{-13}$ cm. Exceptions are formed by the "magic" nuclei (tin, lead, bismuth). The "magic" properties of the nuclei appear to be conserved even in the case of an excitation of the intermediary nucleus up to 20 MeV.

Another dependence on atomic weight is shown by the total cross section for 14 MeV neutrons; the corresponding curve cannot be approximated by a straight line. Consequently, the cross section of the elastic scattering of 14 MeV neutrons is all the less described by a linear dependence.

Text Data

Coverage: This edition of the original book by the late Prof. Fedorov in a large part has been re-written, as a result of advice and instructions from technical educational institutions and a special conference for the revision of the text held at the Main Administration of Highways. The book covers introductory information, description and use of instruments,

FEDOROV, N.V., Prof.

Geodezy

AID 162 - I

detailed instructions in geodetical and topographical field work: surveying measurements, leveling, evaluation of the results, drafting, etc.

This can be considered a good textbook for theoretical and mainly practical use. Numerous Russian names are mentioned in connection with the development of the science and the adaptation of new instruments constructed in the U.S.S.R.

Purpose: The book is recommended as a text and reference book to students of higher technical schools of road construction by the Main Administration of Highways of the Ministry of Interior, U.S.S.R.

TITLE: Small-size atomic electric power installation TES-3

SOURCE: Atomnaya energiya, v. 17, no. 6, 1984, 448-452

TOPIC TAGS: small atomic power installation, portable atomic power installation, nuclear reactor, electric power generation/TES-3 reactor

ABSTRACT: The paper is a summary of the SSSR report #310 at the Third International Conference on Peaceful Uses of Atomic Energy in Geneva, 1984. It describes a movable small-size atomic electric power installation with the water cooled and moderated TES-3 reactor (under 10,000 kw). It consists of four

Cord1/2

L 21211-65

blocks each of which was assembled at the manufacturing plant, and which are placed on four self-propelled flatcars on caterpillar tracks. No housing is required for the installation; the only local preparation needed is the radiation protection. The results with a demonstration model show a satisfactory agreement between the theoretically expected and actually obtained parameters of the installation. Orig. art. has: 4 figures

Translation from: Referativnyy zhurnal. Elektrotehnika, 1957, Nr 5, p 126 (USSR)

AUTHOR: Fedorov, N. Ye., Rogov, I. A.

TITLE: Electrical Smoking by the N. Ye. Fedorov's and I. A. Rogov's Method and Storing Meats and Fish Products (Elektropocheniye po metodu N. Ye. Fedorova i I. A. Rogova i khraneniye myasnykh i rybnykh produktov)

PERIODICAL: Tr. Mosk. tekhnol. in-ta myas. i moloch. prom-sti, 1956, Nr 6, pp 23-34

ABSTRACT: In smoking foodstuffs, flue gases from an incomplete combustion of firewood represent the smoking agent. The smoking process is very slow and takes 2-4 days depending on the product. It is suggested that the products be smoked in an electric high-voltage field; the product should be placed between two electrodes, one of which is connected to a DC high-voltage source and the other to the ground. The smoke is passed between the electrodes, its particles are ionized, an oriented electron stream is formed, and the product placed

Card 1/2

SOV/112-57-5-10425

Electrical Smoking by the N. Ye. Fedorov's and I. A. Rogov's Method and

between the electrodes is quickly smoked by the powerful bombardment of electrons, ions, and charged particles. The accompanying formation of ozone secures an additional microbiological curing of the product surface. A production line can be arranged by placing the products on a conveyer. The smoking period in an experimental outfit using 40-60 kv was several thousand times shorter than with the conventional method; the period was as short as 30-150 sec with 40-60 w power. A sketch of the electrical-smoking outfit and its principal connection diagram are presented. Experiments have shown that the quality of the smoked products is entirely satisfactory.

Title : Calculation of Insulation Under Conditions of Optimal
Thermal Conditions at Lowest Operational Cost of the
Insulation

Orig Pub : Tr. Mosk. tekhnol. in-t myas. i moloch. prom-sti, 1956,
No 6, 155-162

Abstract : The proposed method for calculating heat losses makes
it possible to determine the thickness of insulation of
an apparatus, that ensures lowest expenditures in utili-
zing the insulation, of replacement of old insulation by
a new one, for the purpose of reducing operational cost.

TITLE: Sensitivity of x ray spectral analysis and selection of optimum conditions for recording spectra

SOURCE: Zavodskaya laboratoriya, v. 32, no. 6, 1966, 687-693

TOPIC TAGS: spectrum analysis, x ray analysis, mathematic analysis

ABSTRACT: The article describes an attempt to establish the optimum dimensions of the aperture of an amplitude analyzer, at which there will be achieved the maximum possible analytical sensitivity. The article is a mathematical treatment of the problem, based on experimental data. The first section is a mathematical development of the basic relationships determining the sensitivity. The authors then pass on to a choice of the optimum width of the channel of the pulses being recorded. Under this section, two methods are considered: the crystal diffraction method, and the non-dispersion method (non-crystal). The final section is a statistical evaluation of the optimum sensitivity. It concludes with a series of curves which make it possible to evaluate the loss of sensitivity when operating with non-optimum dimensions of the aperture of the recording spectrometer. Orig. art. has: 6 formulas, 3 figures, and 2 tables.

PREFACE: This book is intended for the general reader.
 GOVERNOR: The book is a compilation of articles which appeared in the newspaper Pravda after the launching, orbiting, and re-
 August 19, 1960. The articles give some details of scientific research undertaken in this flight in the fields of scientific
 biology, genetics, cosmic radiation, solar radiation, ultra-
 violet radiation, and radiation levels. A description, ultra-
 three photos of the capsule are given. No personalities are
 mentioned. There are no references.

AUTHORS: Rybachuk, V.N., and Fedorov, P.D., Dotsents 3-58-5-19/35
TITLE: Preparing for the New Enrollment (Gotovyas' k novomu priyemu)
PERIODICAL: Vestnik Vysshey Shkoly, 1958, pp 66 - 67 (USSR)

ABSTRACT: For the majority of vuzes the school year 1957-58 is notable because of the considerable number of ex-service men and workmen with 2 years of practical experience who have enrolled. At the Kiyev Technological Institute of the Food Industry, 40% of the entire number admitted to the 1st course are former workmen and demobilized soldiers passed the examination with only "satisfactory" while of the school graduates only 14.6% received this mark. This proves the workmen's and soldiers' lack of knowledge, and the difficulties they are meeting in the vuz. The number of these students will be larger this year and the author emphasizes the necessity of stricter entrance examinations. The authors regard it advisable to allot 60% of the places to those who can enter without competition. During the coming years the higher schools will be filled-out primarily by youth coming from factories. This makes it necessary to form the teaching process in such a manner that the graduates can be rightly looked upon as top specialists.
